Sayısal Integrasyon Kavramı ve Çeşitleri

$$\int_a^b f(x). dx \approx yaklaşık hesaplama$$
 fikirlerinin bütününe sayısal integrasyon denir

Sayısal Analiz dersinde Newton Cotes formüllerine odaklanacağız

polinom
$$f_n(x) = a_0 + a_1 x + a_2 x^2 + ... + a_n x^n$$

$$\int_a^b f(x) . dx \approx \int_a^b f_n(x) . dx \approx$$

Polinomu doğru, parabol, kübik bir ifade olarak uydurabiliriz. Bunların her biri de Newton Cotes için bir alt başlıktır

$$I = \int_{a}^{b} f(x) \, dx$$

İntegralin sınırları olan a ve b sayıları sabit ve fonksiyon bu aralıkta sürekli ise integralin sonucu da sabit olup, değeri y=f(x) eğrisinin altında ve x=a ile x=b doğruları arasında kalan alana eşittir

Sayısal Integral Çeşitleri

$$f_n(x) = a_0 + a_1 x$$

YAMUK Kuralı (Trapezoidal Rule) Parabol Uydurma

$$f_n(x) = a_0 + a_1 x + a_2 x^2$$

TRAPEZ (YAMUK) YÖNTEMİ

Bu yöntemde integral **n** sayıda dikdörtgen kullanılarak hesaplanır N ne kadar büyük ise gerçek değere o kadar yakın sonuç elde edilir

$$I = \sum h_i f_i$$
 $f_i \rightarrow f(x_i)$
 $h_i \rightarrow i$. dikdörtgenin genişliği
 $h_i = x_{i+1} - x_i$ olarak tanımlanır

Eğer dikdörtgenlerin genişliği sabit olduğundan h= $\frac{b-a}{n}$ olarak yazılır

 $\mathbf{I} = \int_a^b f(x). dx$ integralinin değerini hesaplamak üzere [a, b] kapalı aralığını **n** eşit parçaya ayıralım

Her bölme noktasından (xi) dik doğrular çıkarak, diklerin f(x) eğrisini kestiği noktaları birer doğru ile birleştirerek n tane yamuk elde edebiliriz x_0ABx_1 dik yamuğunun alanı :

Toplam Alan
$$S = S_{1+}S_{2+}S_3 + ... + S_n$$
 olacağından

$$S = \frac{1}{2} h(y_0 + y_1) + \frac{1}{2} h(y_1 + y_2) + \frac{1}{2} h(y_2 + y_3) + ... + \frac{1}{2} h(y_{n-1} + y_n)$$

$$S = h/2 [y_0 + 2y_1 + 2y_2 + 2y_3 + ... + 2y_{n-1} + y_n]$$

S =
$$h \left[\frac{(y_0 + yn)}{2} + y_1 + y_2 + y_3 + ... + y_{n-1} \right]$$

$$S = h \left[\frac{y_0 + y_n}{2} + \sum_{i=1}^{n-1} y_i \right]$$

$$a \rightarrow x_0$$
 $b \rightarrow x_n$ $h = \Delta x = (x_n - x_0)/n$ olarak kabul edersek

$$S = \Delta \mathbf{x} \left[\frac{f(x_0) + f(x_n)}{2} + \sum_{k=1}^{n-1} f(x_0 + k\Delta \mathbf{x}) \right]$$

$$\int_0^1 \frac{1}{1+x^2} \ dx$$

İntegralini n=4 alarak Trapez yöntemi ile hesaplayınız.

$$x_0 = 0$$
 $x_n = 1$ $h = (1 - 0)/4 = 0.25$

x2	0,5	+0,25	0,8
х3	0,75	+0,25	0,64
x4	1		0,5

$$S = 0.25 \left[\frac{1 + 0.5}{2} + (0.9412 + 0.8 + 0.64) \right]$$

$$S = 0.78279 \text{ br}^2$$

SIMPSON YÖNTEMİ (1/3 kuralı)

$$f(x) = ax^2 + bx + c$$
 şeklinde verilmiş ise

$$S = \int_{a}^{b} f(ax^{2} + bx + c) dx$$

Analitik olarak incelersek

$$S = a \frac{x^3}{3} + b \frac{x^2}{2} + cx \begin{vmatrix} h \\ -h \end{vmatrix} = a \frac{h^3}{3} + b \frac{h^2}{2} + ch - [-a \frac{h^3}{3} + b \frac{h^2}{2} - ch]$$

$$S = \frac{2}{3}ah^3 + 2ch = \frac{h}{3}(2ah^2 + 6c)$$

Denklemin katsayıları bilinmediğinden S eşitliğini y_0, y_1, y_2 cinsinden bulalım

$$x = -h$$
 için $f(x) = y_0 = ah^2 - bh + c$
 $x = 0$ için $f(x) = y_1 = c$
 $x = h$ için $f(x) = y_2 = ah^2 + bh + c$

$$y_0 + y_2 = ah^2 - bh + c + ah^2 + bh + c = 2ah^2 + 2c$$

c =
$$y_1$$
 olduğundan:
 $2ah^2 + 2y_1 = y_0 + y_2$
 $2ah^2 = y_0 - 2y_1 + y_2$

$$S = h/3 (y_0 - 2y_1 + y_2 + 6y_1)$$

 $S = h/3 (y_0 + 4y_1 + y_2)$

Simpson yönteminde çubuklar ikişer ikişer alındığından aralık sayısı ÇİFT olmalıdır

Simpson formülünde $h = (x_n - x_0) / n$ alınarak
